Acute limb ischaemia represents a considerable risk both for the affected limb and for the patient's life. Thus, besides rapid diagnostic investigation, careful assessment of the therapeutic options is crucial for the further clinical course. This book gives a practical explanation and critical analysis of the different endovascular, pharmacological and vascular surgery treatment options for thrombectomy in the arterial and venous circulation. The authors from various vascular disciplines, who are experts in the respective use of the techniques, critically analyse the relevant procedures in an interdisciplinary context and present many useful tips and tricks for everyday clinical practice.
